Product description

End matching is a type of join between panels, cladding and timber battens. End matched tongue and groove panelling means the timber battens or boards have a tongue machined on one end of the board and a groove machined on the other end of the board. It is a stronger and more waterproof joint compared to butt joining timber.

End matching can also reduce waste from 10% to as low as 5% depending on the product as it means you do not have to trim boards or battens to join over a stud, fixing batten or mounting rail. Not having to trim the boards also saves on installation time.

We offer a number of end matching timber products which can be used for a fast, low waste and high quality result.

For more information, please get in touch with our timber experts. We can offer project support and advice to help you bring your vision to life in the best way possible.
